                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note="EGF; Region: EGF-like domain. There is no clear separation between noise and signal. pfam00053 is very similar, but has 8 instead of 6 conserved cysteines. Includes some cytokine receptors. The EGF domain misses the N-terminus regions of the Ca2+ binding EGF domains. The family is hard to model due to many similar but different sub-types of EGF domains. Pfam certainly misses a number of EGF domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            linear PAT 27-AUG-2002

Draft entry and computer-readable sequence for [1] kindly provided
by G.Sarkar, 18-JUL-1989.
WGS-discovery: Paired-end low-coverage whole genome shotgun reads were generated from 12981/SvImJ, C3H/HeJ, and BALBA/CByJ. The WGS reads were placed uniquely on the MGSCv3 C57BL/6J assembly and SNP detection was carried out by SSAHA-SNP. 225,000 reads were
                                                                                                                        as STSs and 81,000 SNPs were annotated with alleles from C57BL/6J and the train from which the particular read came. The validation rate for these SNPs was estimated at approximately 98%.
